### Final Test Report

Page 1 of 16

Specimen	Test Name	Result	Units	Reference Range / Method
<b>HAEMATOLOGY</b>				
<b>PHC PACKAGE 8 - I2H, Men</b>				
<b>Complete Blood count</b>				
EDTA BLOOD	Total WBC count	7280	cells/cum m	4500 - 11000 (Fluorescent Flow Cytometry)
<b>DIFFERENTIAL COUNT.</b>				
EDTA BLOOD	NEUTROPHILS	49.70	%	40.00 - 70.00 (Fluorescent Flow Cytometry)
EDTA BLOOD	LYMPHOCYTES	43.70	%	20.00 - 45.00 (Fluorescent Flow Cytometry)
EDTA BLOOD	EOSINOPHILS	1.50	%	1.00 - 7.00 (Fluorescent Flow Cytometry)
EDTA BLOOD	MONOCYTES	4.30	%	2 - 7 (Fluorescent Flow Cytometry)
EDTA BLOOD	BASOPHILS	0.80	%	0.00 - 1.00 (Fluorescent Flow Cytometry)
EDTA BLOOD	Haemoglobin	<b>13.4</b>	g/dL	14.0 - 18.0 (Non-Cyanide Haemoglobin Analysis)
EDTA BLOOD	PCV	42.7	%	40.0 - 54.0 (Electrical Impedance (RBC pulse height detection))
EDTA BLOOD	Red Blood Cell (RBC) Count	4.58	million/cu mm	4.50 - 6.20 (Electrical Impedance)
EDTA BLOOD	MCV	93.2	fl	82.0 - 98.0 (Calculated)
EDTA BLOOD	MCH	29.3	pg	26.0 - 34.0 (Calculated)

Page 10 of 1

Specimen	Test Name	Result	Units	Reference Range / Method
<b>Note:</b> To detect early kidney disease in those with diabetes or other risk factors such as hypertension, heart failure, cirrhosis, or systemic lupus erythematosus (SLE). According to the American Diabetes Association and National Kidney Foundation, those with type 1 diabetes should get tested starting 5 years after onset of the disease and then annually, and with type 2 diabetes should get tested starting at the time of diagnosis and then annually. Patients with hypertension may be tested at regular intervals, with the frequency determined by their healthcare practitioner. Persistent increased protein in the urine (two positive tests over 3 - 6 months) is the principal marker of kidney damage, acting as an early and sensitive marker in many types of kidney disease.

**Final Test Report**

Page 12 of 1

Specimen	Test Name	Result	Units	Reference Range / Method
<b>IMMUNOLOGY</b>				
<b>PHC PACKAGE 8 - I2H, Men</b>				
<b>FREE TFT</b>				
Serum	FREE T3	3.17	pg/ml	2.00 - 4.40 (ECLIA)
Serum	FREE T4	1.15	ng/dl	0.93 - 1.70 (ECLIA)
Serum	TSH	1.380	uIU/ml	0.270 - 5.350 (ECLIA)
<b>Note:</b> TSH has a diurnal rhythm, peaks at 2.00-4.00 am and has lowest level at 5.00-6.00 pm with ultradian variation. Hence thyroid test is only a snapshot of what is occurring within a dynamic system and for treatment purpose, the results should be accessed in conjugation with patient medical history, clinical examination & other tests/finding for confirmation. Many multivitamins (such as Vit B7), supplements (especially hair, skin, and nail) and over-the-counter and prescription medications may affect thyroid test results, and their use should be discussed with the healthcare practitioner prior to testing. When a high serum TSH concentration and normal free T4 is found, repeat measurement 3-6 months later along with thyroid antibodies after excluding nonthyroidal illness and drug interference is recommended.				
Serum	25 Hydroxyvitamin D	<b>18.6</b>	ng/ml	Deficiency : $\leq 20$ Insufficiency: 21 - 29 Sufficiency : $\geq 30$ (ECLIA)
<b>Comments :</b> Vitamin D is a fat-soluble steroid hormone precursor that is mainly produced in the skin by exposure to sunlight. Vitamin D is biologically inert and must undergo two successive hydroxylations in the liver and kidney to become the biologically active 1,25 - dihydroxyvitamin D. It is commonly agreed that 25-hydroxyvitamin D is the metabolite to determine the overall vitamin D status as it is the major storage form of vitamin D in the human body. This primary circulating form of vitamin D is present human body with levels approximately 1000 fold greater than the circulating 1,25-dihydroxyvitamin D. The half-life of circulating 25-hydroxyvitamin D is 2-3 weeks. <b>Vitamin D is essential for :</b> Bone health. In children, severe deficiency leads to bone-malformation, known as rickets. Milder degrees of insufficiency are believed to cause reduced efficiency in the utilization of dietary calcium. <b>Vitamin D deficiency causes :</b> Muscle weakness in elderly, the risk of falling has been attributed to the effect of vitamin D on muscle function. Vitamin D deficiency is a common cause of secondary hyperparathyroidism. Elevations of PTH levels, especially in elderly vitamin D deficient adults can result in osteomalacia, increased bone turnover, reduced bone mass and risk of bone fractures. Low vitamin D (25-OH) concentrations are also associated with lower bone mineral density. The results should always be assessed in conjunction with the patient's medical history, clinical examination and other findings.				
Serum	VITAMIN B 12	398	pg/ml	197 - 771 (ECLIA)

Page 13 of 1

Specimen	Test Name	Result	Units	Reference Range / Method
<b>Note:</b> Vitamin B12 or cyanocobalamin, is a complex corrinoid compound found exclusively from animal dietary sources, such as meat, eggs and milk. It is critical in normal DNA synthesis, which in turn affects erythrocyte maturation and in the formation of myelin sheath. Vitamin-B12 is used to find out neurological abnormalities and impaired DNA synthesis associated with macrocytic anemias. The test results should always be assessed in conjunction with the patients medical history, clinical examination and other findings.				
Serum	FERRITIN	56.6	ng/ml	New born : 25 - 200 1 month : 200 - 600 2-5 months: 50 - 200  6 months - 15y : 7 - 140  Adult Male : 20-250 Female: 10-120 (ECLIA)
Serum	INSULIN (F)	18.88	uIU/ml	Fasting: 2.6 - 24.9 (ECLIA)
Determination of insulin is utilized in the diagnosis and therapy of various disorders of carbohydrate metabolism, including diabetes mellitus and hypoglycemia. Elevated levels: Acromegaly, Cushing syndrome, Use of corticosteroids, levodopa, oral contraceptives, Fructose or galactose intolerance, Insulinomas, Obesity and Insulin resistance. Decreased levels: Diabetes, Hypopituitarism and Pancreatic diseases. Patients treated with bovine, porcine or human insulin sometimes contain anti-insulin antibodies which can affect the test result. Samples should not be taken from patients receiving therapy with Vit B7 doses (i.e. > 5 mg/day) until at least 8 hours following the last administration. For diagnostic purposes, Insulin levels must be evaluated in context with the patient's medical history, clinical examination and other findings.				
Serum	PSA	0.541	ng/ml	< 4.0 (ELFA)
This assay, a quantitative in vitro diagnostic test for total (free + complexed) prostate-specific antigen (tPSA) in human serum and plasma, is indicated for the measurement of total PSA in conjunction with digital rectal examination (DRE) as an aid in the detection of prostate cancer in men aged 50 years or older. Prostate biopsy is required for diagnosis of prostate cancer. The test is further indicated for serial measurement of tPSA to aid in the management of cancer patients. The PSA test may give false-positive or false-negative results due to various factors. Rigorous physical activity affecting the prostate, such as bicycle riding, may cause a temporary rise in PSA level. Ejaculation within 24 hours of testing can be associated with elevated PSA levels and should be avoided. Large doses of some chemotherapeutic drugs, such as cyclophosphamide and methotrexate, may increase or decrease PSA levels. An inflammation or trauma of the prostate (e.g. in cases of urinary retention or following rectal examination, cystoscopy, coloscopy, transurethral biopsy, laser treatment or ergometry) can lead to PSA elevations of varying duration and magnitude.				
Serum	FOLIC ACID	6.7	ng/ml	Male : 4.5 - 32.2 Female : 4.8 - 37.3 (CMIA)

Specimen	Test Name	Result	Units	Reference Range / Method
----------	-----------	--------	-------	--------------------------

**Comments:-** Folic acid, also known as folates, are class of vitamin compounds, essential for nucleic acid and mitochondrial protein synthesis, amino acid metabolism and aids in rapid cell division and growth. Deficiency seen in pregnancy, low dietary intake, macrocytic and megaloblastic anaemia, drugs (phenytoin, methotrexate, sulphasalazine, triamterene, pyremethamine, trimethoprim-sulphamethoxazole, barbiturates and oral contraceptives), chronic alcoholism, Crohn's disease, Celiac disease, malabsorption syndromes, ileo-jejunal surgeries. Deficiency is also associated with neural tube defects in developing embryo. Low serum folate levels reflect the first stage of negative folate balance. Low RBC folate reflects second stage of negative folate balance and more closely correlates with tissue levels and megaloblastic anaemia.
